

# SMFUTIL

## Advantages of using SMFUTIL for *Efficient Data Retrieval*

- Archive Directory can be used to *"Isolate"* user from location of data
- Input can start on any volume of multi-volume dataset
- Complete control over data selected for retrieval: *"Include" Filtering and "Exclude Filtering"*
- Speed of execution
- Multiple outputs per pass of the data - less EXCP's to create required subset
- Complete user exit support for special processing
- Security exit to control access to data at record type level
- Automatic dynamic allocation of MANx Dataset containing data (in correct date/time order) - appends current SMF Data to archive retrieval
- Automatic optimal DCB specification of output datasets
- "Survives"* invalid input blocksize on existing archives
- Existing historical data can be *"Archived"* by just reading it
- Bullet Proof I/O engine – can survive any input I/O error the device can span!
